Sale Terms & Conditions

Any bull not sold in the ring will attract a \$250 premium per head after the sale.

There may be NO SUBSTITUTIONS of bulls. (Please note this is a decision made by the vendors)

Insurance Disclaimer

Insurance risk of stud animals sold at auction transfers to the purchaser at the fall of the hammer including animals remaining on the vendor's property. Purchasers therefore are advised to insure their animals at the completion of the sale. Stud animals are not covered by Commercial Livestock Insurance.

Inspection Disclaimer

The 2024 Supreme Sale Bulls presented by vendors have been thoroughly inspected by the nominated WALSA agents, with a heavy emphasis on sound feet and structure for a working Sire.

Understanding BREEDPLAN EBV's and Accuracy's

Calving Ease EBVs (%) are based on calving difficulty scores, birth weights and gestation length information. More positive EBVs are favourable and indicate easier calving.

CE % Direct = Direct Calving Ease - The EBV for direct calving ease indicates the influence of the sire on calving ease in purebred females calving at two years of age.

CE% Daughters = Daughters' Calving Ease - The EBV for daughters' calving ease indicates how easily that sire's daughters will calve at two years of age. It consists of the maternal component and half the direct component (ie CE maternal + ½ CE direct).

Gestation Length EBV (days) is an estimate of the time from conception to the birth of the calf and is based on AI and hand mating records. Lower (negative) GL EBVs indicate shorter gestation length and therefore easier calving and increased growth after birth.

Birth Weight EBV (kg) is based on the measured birth weight of progeny, adjusted for dam age. The lower the value the lighter the calf at birth and the lower the likelihood of a difficult birth. This is particularly important when selecting sires for use over heifers.

200-Day Growth EBV (kg) is calculated from the weight of progeny taken between 80 and 300 days of age. Values are adjusted to 200 days and for age of dam. This EBV is the best single estimate of an animal's genetic merit for growth to early ages.

400-Day Weight EBV (kg) is calculated from the weight of progeny taken between 301 and 500 days of age, adjusted to 400 days and for age of dam. This EBV is the best single estimate of an animal's genetic merit for yearling weight.

600-Day Weight EBV (kg) is calculated from the weight of progeny taken between 501 and 900 days of age, adjusted to 600 days and for age of dam. This EBV is the best single estimate of an animal's genetic merit for growth beyond yearling age.

Mature Cow Weight EBV (kg) is based on the cow weight when the calf is weighed for weaning, adjusted to 5 years of age. This EBV is an estimate of the genetic difference in cow weight at 5 years of age and is an indicator of growth at later ages and potential feed maintenance requirements of the females in the breeding herd. Steer breeders wishing to grow animals out to a larger weight may also use the Mature Cow Weight EBV.

Milk EBV (kg) is an estimate of an animal's milking ability. For sires, this EBV indicates the effect of the daughter's milking ability, inherited from the sire, on the 200-day weights of her calves. For dams, it indicates her milking ability.

Scrotal Size EBV (cm) is calculated from the circumference of the scrotum taken between 300 and 700 days of age and adjusted to 400 days of age. This EBV is an estimate of an animal's genetic merit for scrotal size. There is also a small negative correlation with age of puberty in female progeny and therefore selection for increased scrotal size will result in reduced age at calving of female progeny.

Days to Calving EBV (days) indicates the fertility of the daughters of the sire. It is the time interval between when the female is first exposed to a bull in a paddock mating to the day when she subsequently calves. A negative EBV for days to calving indicates a shorter interval from bull-in date to calving and therefore higher fertility.

Carcase Weight EBV (kg) is based on abattoir carcass records and is an indicator of the genetic differences in carcass weight at the standard age of 650 days.

Eye Muscle Area EBV (sq cm) is calculated from measurements from live animal ultrasound scans and from abattoir carcass data, adjusted to a standard 300 kg carcass. This EBV estimates genetic differences in eye muscle area at the 12/13th rib site of a 300 kg dressed carcass. More positive EBVs indicate better muscling on animals. Sires with relatively higher EMA EBVs are expected to produce better-muscled and higher percentage yielding progeny at the same carcass weight than will sires with lower EMA EBVs.

Rib Fat and Rump Fat EBVs (mm) are calculated from measurements of subcutaneous fat depth at the 12/13-rib site and the P8 rump site (from live animal ultrasound scans and from abattoir carcasses) and are adjusted to a standard 300 kg carcass. These EBVs are indicators of the genetic differences in fat distribution on a standard 300 kg carcass. Sires with low, or negative, fat EBVs are expected to produce leaner progeny at any particular carcass weight than will sires with higher EBVs.

Retail Beef Yield EBV (%) indicates genetic differences between animals for retail yield percentage in a standard 300 kg carcass. Sires with larger EBVs are expected to produce progeny with higher yielding carcasses.

Intramuscular Fat EBV (%) is an estimate of the genetic difference in the percentage of intramuscular fat at the 12/13th rib site in a 300 kg carcass. Depending on market targets, larger more positive values are generally more favourable.

Docility EBV (%) is calculated from docility scores taken at weaning or shortly afterwards. This EBV is an estimate of the genetic difference in the percentage of progeny that will be scored as docile or restless (scores 1 or 2).

Net Feed Intake (Feedlot Finishing) EBV (kg) is an estimate of genetic differences between animals in feed intake at a standard weight and rate of weight gain when animals are in a feedlot finishing phase. NFI-F EBVs as expressed as kilograms (kg) of feed intake per day. Lower, or more negative, NFI-F EBVs are more favourable. For example, a bull with an NFI-F EBV of -0.6 kg/day would be expected to produce progeny that eat less feed per day than the progeny from a bull that has an NFI-F EBV of +0.8 kg/day (when the progeny are of similar weight, are growing at a similar rate, and are in a feedlot finishing phase).

Accuracy (%) is based on the amount of performance information available on the animal and its close relatives - particularly the number of progeny analysed. Accuracy is also based on the heritability of the trait and the genetic correlations with other recorded traits. Hence accuracy indicates the "confidence level" of the EBV. The higher the accuracy value the lower the likelihood of change in the animal's EBV as more information is analysed for that animal or its relatives. Even though an EBV with a low accuracy may change in the future, it is still the best estimate of an animal's genetic merit for that trait. As more information becomes available, an EBV is just as likely to increase in value, as it is to decrease.

Accuracy values range from 0-99%. The following guide is given for interpreting accuracy:

Accuracy range	Interpretation
less than 50%	EBV should be considered as a preliminary estimate. It could change substantially as more performance information becomes available.
50-74%	Medium accuracy, usually based on the animal's own records and pedigree. Still subject to substantial changes with more information, particularly when the performance of progeny are analysed.
75-90%	Medium - high accuracy and includes some progeny information. Becoming a more reliable indicator of the animal's value as a parent.
more than 90%	High accuracy estimate of the animal's true breeding value. It is unlikely that the EBV will change much with the addition of more progeny data.

BREEDPLAN

UNDERSTANDING IGS EPD'S

UNDERSTANDING THE IGS EPD SUITE

MATERNAL EPDS

CALVING EASE DIRECT (CE-D)

Reported as the percentage of extra unassisted births in first calving heifers, relative to the average. CE-D is relative to the direct Calving Ease of the animal. Higher values are more favourable.

CALVING EASE MATERNAL (CE-M)

Reported as the percentage of extra unassisted births in first calving heifers, relative to the average. CE-M is relative to the Calving Ease of the daughters of the animal. Higher values are more favourable.

MILK

Reported as pounds of weaning weight of progeny from the animals daughters, relative to the average. Predicts the difference in maternal production of daughters relative to milk production and mothering. Values are relative to the environment of the production system. Low input environments should be very conscious of introducing too much milk due to the increased nutrient requirements that it can place on cows.

MATERNAL WEANING WEIGHT

Reported as pounds of weaning weight of progeny from the animals daughters, relative to the average. This is a measure of weaning weight differences relative to the combined effects of growth and milk. Breeders who are not looking to change milk production should consider Total Maternal as the most relevant EPD for maternal weaning weights. Higher values are more favourable.

STAYABILITY (STAY)

Reported as the differences in percentage of a sire's offspring that are predicted to still be in the herd at 6 years of age... given that they calved at 2, relative to the average. Stayability is a measure of reproductive longevity. Higher values are more favourable.

DOCILITY

Reported as the percentage of progeny, relative to the average, that will record a score of docile. Higher values are more favourable.

GROWTH EPD'S

BIRTH WEIGHT

Reported in pounds of birth weight relative to the average. When selecting bulls to use on heifers, breeders should also focus on the Calving Ease EPD as Birthweight is already used in the Calving Ease EPD calculation.

WEANING WEIGHT – ADJUSTED TO 205 DAYS

Reported in pounds of weaning weight of direct progeny, relative to the average. Higher values are usually more favourable dependant on its relationship with birthweight.

YEARLING WEIGHT – ADJUSTED TO 365 DAYS

Reported in pounds of yearling weight of direct progeny, relative to the average. Higher values are usually more favourable dependant on its relationship with birthweight.

CARCASE EPD'S – ADJUSTED TO 475 DAYS OF AGE.

CARCASE WEIGHT

Reported as pounds of Carcase Weight relative to the average. Higher values are usually more favourable, however this is relevant to each producers target martet.

RIB EYE AREA

Reported as square inches relative to the average. Higher values are usually more favourable.

FAT

Reported as inches of back fat relative to the average. Higher values are usually more favourable, however this is requires a balance between adequate doing ability in daughters and carcase fat thresholds for target markets.

YIELD GRADE

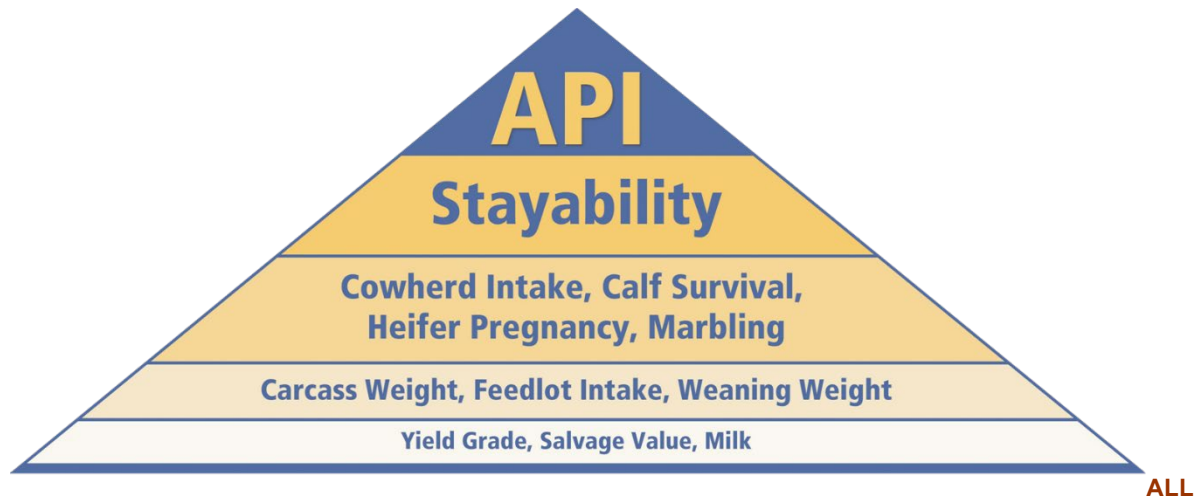

Reported as expected differences in progeny average USDA Yield Grade scores.

Yield Grade is used to improve the yield potential of progeny and may seem a strange value for Australian animals. Whilst Australian animals will never receive a USDA graded Yield Grade score, they will also never receive an actual Retail Beef Yield % value either. However, US Shorthorns (including progeny of Australian sires used in the US) are USDA graded each year and so the pedigree linkages provide linkage to actual USDA Yield Grade values.

Lower values are usually more favourable, however because of the negative correlations between fat and yield it is important to maintain some balance in the selection.

MARBLE SCORE

Reported as the differences in actual carcass marble scores relative to the average. This is different to IMF% which is used as an indicator trait in Marble Score. Higher values are more favourable.

PURPOSE \$INDEX – API

Though EPDs allow for the comparison of genetic levels for many economically important traits, they only provide a piece of the economic puzzle. That's where \$ Indexes come in. Through well conceived, rigorous mathematical computation, \$ Indexes blend EPD's and economics to estimate an animal's overall impact on your bottom line.

The All Purpose \$Index (API) evaluates sires for use on the entire cow herd, bred to both first-calf heifers and mature cows, with the portion of their daughters required to maintain herd size retained and the remaining heifers and steers put onto feed and marketed for both quality grade and yield.

UNDERSTANDING ACCURACIES

BOLT EPD accuracies have experienced the most change, usually lowering numerically and especially for non-parent animals, however the reported accuracy will be more accurate.

Accuracy refers to the amount a reported EPD can possibly change as more data is added. EPD values with higher accuracy result in less possible change for the value over time. More accurate accuracies better represent the amount of possible change for each EPD.

HEREFORD

We begin our sale with an outstanding draft of 16 young Hereford bulls, offered today on account of RC & HM Fransis and Quaindering. With all bulls offering an array of market opportunity, we are sure you will find something to suit your breeding objectives for the coming joining.

Please see below for your reference the most recent BREEDPLAN averages for 2022 born calves.

	70%	51%	64%	65%	67%	59%	54%	45%	49%	52%	45%	49%	

COMMENTS: A favourite with all who have inspected him, T 18 ran with cows for 12 weeks as a yearling back up sire. By the prepotent Yallaroo Ranger R9 (P) who has bred extremely well here at Yallaroo and also for buyer Tone Bridge Grazing. A long, thick and well pigmented sire with an outstanding temperament, even by Yallaroo standards, with dark colour. His dam is considered our top cow in the herd. Genomic and semen tested.

Purchaser..... Price.....

Lot:3		YALLAROO THURSDAY T5 (PP)						Ident: 5FPT005

	73%	25%	56%	50%	52%	27%	32%						

COMMENTS: Built like a brick. He's a solid little log. By a different sire so doesn't have the height of the other bulls but is just packed with red meat. He has the lines that will catch your eye. A bull I would put over heifers to make sure their calves have punch. Semen tested, vaccinated 7 in 1 and Pestiguard.

LIMOUSIN

With only three Limousin bulls in this year's sale draft, it is important to note that while quantity may, quality is definitely not lacking. With each yearling offering so much potential, these three are not to be missed. Selling on account of Michael Donaghy, make sure you get a good look at these three.

Please see below for your reference the most recent BREEDPLAN averages for 2022 born calves.

COMMENTS Check this mid sized, ideal confirmation, muscle package. He has perfect docility and a raging amount of rump muscle. He is ideal for heifer joining, and will also suit mature cows at the same time. His EBV's point to his calves producing solid weight gains. Want small calves that grow into big calves quick?

	Birth Wt (kg)	Milk (kg)	200 Day Wt (kg)	400 Day Wt (kg)	600 Day Wt (kg)	Scrotal Cir. (cm)	Carcase Wt (kg)	EMA (sq.cm)	Rib Fat (mm)	Rump Fat (mm)	RBY (%)	IMF (%)
	+1.1	+12	+26	+51	+63	+1.4	+45	+3.0	-0.2		+1.1	+0.1
	46%	35%	43%	44%	43%	35%	34%	25%	29%		25%	25%

COMMENTS Look at the large framed, soft finish on this polled bull. He is only 21 months of age, and is sure to grow into a top working bull. His EBV's point to sound calf birth weight of progeny, and with his great docility. This bull has EBV figures that including top 5% for 400 day weight gain. He comes into the sale at 21 months of age.

2024 GROUP BREEDPLAN EBV's

	Birth Wt (kg)	Milk (kg)	200 Day Wt (kg)	400 Day Wt (kg)	600 Day Wt (kg)	Scrotal Cir. (cm)	Carcase Wt (kg)	EMA (sq.cm)	Rib Fat (mm)	Rump Fat (mm)	RBY (%)	IMF (%)
	+2.6	+7	+25	+41	+59	+0.8	+34		+0.5			
	49%	32%	43%	42%	43%	29%	31%		26%			

COMMENTS This bull displays a perfect larger frame score. He is extremely well bred. EBV's in the top 30% or better for the 200, 400 and 600 day weight gains for the breed. Polled, and ready for work, being just over two years of age. A great terminal sire for any herd.

Purchaser: **Price:**

SPECKLE PARK

To round out the sale we have a small but mighty offering, representing the Speckle Park breed on account of Arley Farm Speckle Park Stud. These bulls have a lot to offer anyone looking to incorporate Speckle Park genetics into their herd.

Please see below for your reference the most recent BREEDPLAN averages for 2022 born calves.

Breed Averages for 2022 Born Calves														
	Gestation Length (days)	Birth Wt (kg)	200 Day Wt (kg)	400 Day Wt (kg)	600 Day Wt (kg)	Mat Cow Wt (kg)	Milk (kg)	Scrotal Size (cm)	Carcase Wt (kg)	Eye Muscle Area (sq cm)	Rib Fat (mm)	Rump Fat (mm)	Retail Beef Yield (%)	IMF (%)
EBV	+0.0	+1.7	+16	+24	+32	+34	+5	+0.2	+20	+0.5	+0.2	+0.2	-0.1	+0.1

SPECKLE PARK

Lot: 96 **ARLEY THUNDER T4** **Ident: ARL T4**

ELDERS Arley Farm Speckle Park Stud **Born: 05/03/2022**

SIRE: MAUNGAHINA LEGACY (AI) (ET) (Leopard)
 MAUNGAHINA NIKKO (S) (Speckled)
 MAUNGAHINA J13 (P) (Speckled)

 GIN GIN LITTLE MISS PUTNAM (AI) (ET) (P) (White)
 CODIAK AMANDA GNK 42Y (P) (Speckled)

2024 GROUP BREEDPLAN EBV's

	Birth Wt (kg)	Milk (kg)	200 Day Wt (kg)	400 Day Wt (kg)	600 Day Wt (kg)	Scrotal Cir. (cm)	Carcase Wt (kg)	EMA (sq.cm)	Rib Fat (mm)	Rump Fat (mm)	RBV (%)	IMF (%)
	+3.8	+6	+21	+31	+43	+0.1	+19	-0.6	+0.3	+0.4	54	-0.1
	70	49	68	66	66	64	56	48	58	57	54	53

COMMENTS: We absolutely love this bull and think that he is the pick of the bunch. Maungahina Nikko is breeding for us, producing very little waste in his progeny. With plenty of depth, length and rib, he has the potential to produce very sound, growthy carcass cattle.

2024 GROUP BREEDPLAN EBV's

	Birth Wt (kg)	Milk (kg)	200 Day Wt (kg)	400 Day Wt (kg)	600 Day Wt (kg)	Scrotal Cir. (cm)	Carcase Wt (kg)	EMA (sq.cm)	Rib Fat (mm)	Rump Fat (mm)	RBV (%)	IMF (%)
	+3.6	+7	+19	+29	+43	+0.3	+20	-0.7	-0.2	-0.3	51	-0.1
	73	50	69	66	66	65	57	46	54	54	51	49

COMMENTS: Both the grandparents of this bull come from the beginnings of Speckle Park. Empire King comes from Star Bank Lacerta 68L, which is widely used throughout the Speckle Park world. Whilst on his dams side he has the great Codiak Putnam. This is an ideal animal to use across an Angus herd if you wish to keep up to 90% black coats. A well-balanced bull. This animal has a place as a terminal or maternal bull.
